Abstract (en)

[origin: WO2021173134A1] Embodiments provide for an apparatus for supporting an intraosseous device disposed at a target site of a patient, and methods of use for the apparatus. In an example, the apparatus includes a cylindrical support structure with a hollow interior, the interior dimensions of the hollow interior greater than exterior dimensions of an intraosseous device. In this way, movement of the support structure may not be translated into movement of the intraosseous device, thereby reducing opportunity for dislodgement of the intraosseous device.
