Abstract (en)
[origin: WO2021170310A1] The invention relates to a crane device comprising an extending element (4) which can move between a base position and an extended position, a support element (5) which runs over at least one deflection (6) secured to the extending element (4), wherein the position of the deflection (6) can be modified when moving the extending element (4), and a drive element (7) which interacts with the support element (5) such that a holding force is exerted onto the extending element (4), said holding force counteracting an extending force, when the extending element (4) is positioned between the base position and the extended position.
