Abstract (en)

[origin: WO2021171310A1] In an example, a system (100) for real-time monitoring of a protein and excipients during formulation of drugs with monoclonal antibodies, comprises a first reservoir (102) with a solution with the protein and the excipients; a first pump (104) coupled to the first reservoir (102) to pass from through a membrane; a first pressure transmitter (108) coupled to an output from the membrane to direct a retentate solution to the first reservoir (102); a second reservoir (110) with a diafiltration buffer solution; a second pump (112) coupled to the second reservoir (110) to pump the diafiltration buffer solution from the second reservoir (110) into the first reservoir (102); and a spectroscopic probe (114) dipped in the first reservoir (102) to continuously acquire the wavelength spectra to monitor the formulation of the protein and the excipients during the formulation.
