Abstract (en)
[origin: EP4112497A1] A substantially parallelepiped containment box (2) has at least one outlet opening (7) delimited by a perimeter frame (8). A door (9) is movable between an opening condition and a closing condition in which it abuts against the perimeter frame (8). At least one hinge (14) has a fixed part (15) rigidly carried by the containment box (2) and a movable part (16) rigidly carried by the door (9). The movable part (16) is rotatable with respect to the fixed part (15) about a hinging axis (Y), and radially translatable to the hinging axis (Y) moving away from and approaching the perimeter frame (8). A protrusion (24) and an abutment seat (25) respectively carried by one and the other of said door (9) and containment box (2) are mutually couplable by interference to bring the door (9) closer to the perimeter frame (8) in the closing condition.
