Abstract (en)  
[origin: WO2021175625A1] A spooling device for line handling on a vessel is disclosed. The spooling device comprises a main drum for spooling of a main line. The main drum is configured to rotate around a longitudinal center axis and is configured to wind and/or unwind the main line in a spooling direction. The spooling device comprises an auxiliary drum for spooling of an auxiliary line connected to a distal end of the main line. The spooling device further comprises a guiding arm movably arranged in relation to the main drum and the auxiliary drum at a distance from the longitudinal center axis in the spooling direction. The guiding arm is configured to perform a sweeping movement in relation to the main drum, such that the guiding arm is configured to guide the auxiliary line onto the auxiliary drum during a spooling procedure.
