Abstract (en)

[origin: WO2021181047A1] Truck (100) having a frame (10) with an end wall (111) receiving the load (CH) and a shaft (20) terminating in a handle (21) and a control unit (22), the frame (10) is supported on two tracked modules (30) connected to the frame (10) by a rotary joint (31) in order to swivel independently of each other, from the side of the frame (10) away from the side of the end wall (111). Each tracked module (30) is connected to the frame (10) by a rotary joint (31) and an extension spring (50) creating a force resisting the collapse of the module (30) against the frame (10), the swivel range of the driven tracked module (30) being limited between a retracted position against the frame (10) and a deployed position defining the upright position of the frame (10).
