Abstract (en)

[origin: WO2022017588A1] The invention relates a container (1) for liquids, comprising: a) a main part (3) with at least one substantially cylindrical cavity (5) for receiving liquids, said cylindrical cavity comprising two opposite end-face surfaces (7, 9) and a circumferential lateral surface (11), wherein the lateral surface extends between the two end-face surfaces substantially along a longitudinal direction (100), at least one of the end-face surfaces defines at least one opening (23) in the main part in order to provide access to the cavity from the outside, the cross-sectional area of the opening equaling at least 70% of the smallest cross-sectional area of the cylindrical cavity, and the main part has at least one first magnetic connection means (15), and b) at least one cover (25) which is adapted so as to close the opening, said cover having at least one second magnetic connection means (17). The cover can be brought into releasable engagement with the main part via a magnetic connection between the first magnetic connection means and the second magnetic connection means.
