Abstract (en)
[origin: WO2021180756A1] A telescopic pillar system (100) is provided comprising a male rail portion (10) having at least one protrusion (12) and a female rail portion (20). The female rail portion (20) has a longitudinal extension and a free end (26) comprising an end plate (40). The end plate (40) comprises at least one through-going opening (42) having a cross-sectional profile as seen in a geometrical plane extending transverse to the longitudinal extension. The cross-sectional profile is complementary to an outer cross-sectional profile of the at least one protrusion (12) of the male rail portion (10), thereby allowing insertion of the at least one protrusion (12) into said at least one through-going opening (42). In an inserted position, the male rail portion (10) is allowed to be displaced along the longitudinal extension of the female rail portion (20) and allowed to be tilted in view of the geometrical plane extending transverse to the longitudinal extension of the female rail portion (20), the longitudinal displacement and tilting being allowed during mounting and after mounting of the telescopic pillar system (100) between two supports.
