Abstract (en)
A variation in flow rate of fluid between nozzles is suppressed in an interlacing device which is configured to interlace yarns. An interlacing device 13 includes nozzles 66 which are aligned in an arrangement direction and by which compressed air is ejected onto yarns Y and a supply passage 70 that is arranged to supply the compressed air to the nozzles 66. The supply passage 70 includes an inflow passage 42 which extends at least in the arrangement direction, a chamber 71 which is provided between the inflow passage 42 and the nozzles 66 in a flow direction of the compressed air and extends in the arrangement direction and in the height direction, and a bended passage 43 which is provided between the inflow passage 42 and the chamber 71 in the flow direction and connects a portion extending in the arrangement direction with a portion extending in a height direction. At least in the bended passage 43, at least one flow adjustment fin 72 is provided to extend in the height direction and to at least partially overlap with an opening 41f (entrance of the bended passage) when viewed in an extending direction in which the inflow passage 42 extends.
