Abstract (en)  
[origin: EP4120451A1] The present invention relates to a button-type secondary battery comprising: a cup which has an opened upper side and in which an electrode assembly and an electrolyte are mounted; and a top plate which is coupled to an upper end of the cup to close the opened upper side of the cup and in which a through-hole is formed; a positive electrode terminal comprising a protrusion having a diameter capable of being inserted into the through-hole and a hook having a diameter greater than that of the through-hole, wherein the protrusion is inserted into the through-hole so that the hook is disposed outside or inside the cup; and a gasket inserted to insulate a portion at which the protrusion and the hook are in contact with the top plate when the protrusion of the positive electrode terminal is inserted into the through-hole, wherein the gasket bonds the positive electrode terminal to the top plate. According to the present invention having the above technical characteristics, since the positive electrode terminal to the top plate are bonded to each other through the gasket that seals the gap between the positive electrode terminal and the top plate, the riveting of the positive electrode terminal or the coupling structure similar to the riveting may be eliminated, and thus, the overall thickness of the secondary battery may be thinner.
