Abstract (en)

[origin: WO2021186316A1] A fuel cell system (1) comprises a supply line for a fuel, for example hydrogen, including a fuel tank (11) and a pressure reducer (12) for obtaining a first stage of reducing the pressure of the fuel coming from the tank (11). A second pressure reduction stage is achieved by means of an electronic pressure regulator (R), which comprises a proportional solenoid valve (100) and an electronic control unit (E1), which communicates with an electronic control unit (E) of the fuel cell (2). The electronic control unit (E1) of the electronic pressure regulator (R) is configured and programmed to control the proportional solenoid valve (100) to regulate the flow rate and pressure of the fuel supplied to the fuel cell (2) according to a demand for electrical energy to be delivered by the fuel cell (2), keeping the difference between the air pressure and the fuel pressure within the fuel cell (2) within a predetermined range. The electronic control unit (E1) of the electronic regulator (R) is also configured and programmed to detect an actuation of a fuel purge valve (16) and/or a water drain valve (33), and to control the proportional solenoid valve in such a way as to compensate for the pressure variations deriving from the aforesaid actuation. The electronic unit (E1) of the pressure regulator (R) also closes a shut-off valve (34) located downstream of the tank (11) when it detects a pressure drop indicative of an abnormal operating condition.
