Abstract (en)

[origin: WO2021069624A1] Disclosed is a system and method for deploying and recovering an autonomous underwater craft (12) by a recovery vehicle (11) towed by a ship (1), the craft (12) is stored in a housing of the recovery vehicle (11), the deployment can be carried out in two stages, a first stage of submerging the recovery vehicle (11) with the craft (12) stored in the recovery vehicle, and a second stage of releasing the craft (12). According to the invention, the ship comprises a launch ramp (10) which is tilting and the system is configured to store the recovery vehicle (11) on the launch ramp (10), the launch ramp (10) being able to take at least two positions: a raised position in which the stored recovery vehicle (11) is out of the water and an inclined position in which the rear end (15) of the launch ramp (10) is immersed, the system comprising a translational device enabling, in the inclined position of the launch ramp (10), the recovery vehicle (11) to move along the launch ramp (10) in order to be submerged and move away from the ship (1) while being towed by the ship during the deployment and in order to be raised along the launch ramp (10) during the recovery. The system and the craft (12) form an underwater exploration assembly.
