Abstract (en)

A method of manufacturing a panel, comprising the steps of supplying a substrate (1), applying a layer of curable substance (3) onto the substrate (1), applying a substantially air-tight foil (6) onto the layer of curable substance (3) such that the layer of curable substance (3) is sandwiched between the substrate (1) and the foil (6), subsequently curing (8) at least a part of the layer of curable substance (3) by means of radiation through the foil (6) resulting in a layer of at least partly cured substance (3', 3''), characterized in that the method comprises a step of applying discrete quantities of an additional substance (5) at a side of the curable substance (3) which is directed away from the substrate (1) and in that after the step of curing (8) the foil (6) and the discrete quantities of an additional substance (5) are removed from the layer of at least partly cured substance (3', 3'') so as to form the panel.
