Abstract (en)

[origin: WO2021198052A1] To improve a medical instrument, more particularly a percussion instrument, having a proximal end and a distal end, a handle and a percussion surface pointing in the proximal direction being arranged or formed on the proximal end and a tool element being arranged or formed on the distal end, and an instrument shaft of the instrument extending from the proximal end to the tool element, said improvement being such that the instrument can more particularly be handled better, it is proposed that the handle is designed in the form of a hollow handle. A method for producing a medical instrument is also proposed.
