Abstract (en)
Snap button for garments, comprising at least one female body (2), extending along a direction of development (X) between a first face (2') and a second face (2''), internally defining at least one housing seat (3) placed in communication with the outside by an access mouth (20) obtained in correspondence with said first face (2'); at least one male body (4) comprising at least one protruding element (5) which can be moved at least along said development direction (X) at least between a closed position, in which it is at least partially housed inside said housing seat (3) of said female body (2) through said access mouth (20) and an opening position, in which it is extracted from said housing seat (4); said female body comprising elastic retaining means (6) arranged in correspondence with said access mouth (20) of said female body (2), configured to detachably retain said protruding element (5) in said closing position and comprising at least an elastically yielding element (7) housed in a groove (8) formed in correspondence with said access mouth (20) and configured to intercept said protruding element (5) of said male body (4) in its movement between said closing position and said open position; said female element comprises at least one abutment wall (9) which delimits said groove (8) and abuts said elastically yielding element (7) to prevent the movements of said elastically yielding element along said development direction (X).
