Abstract (en)
[origin: WO2021245479A1] A linear drain group of fluids from an environment having a collection channel (3) of fluids to be drained and comprising: at least one cover body (5), superimposed on the collection channel (3), and a plurality of support feet (6) coupled to the cover body (5) and arranged resting on the collection channel (3) to support the weight of the at least one cover body (5). Discharge unit (1) also comprising at least one drain hole (7) located on the bottom (10) of the collection channel (3) and shaped to allow the flow of fluids to be drained. Such a collection channel (3) comprising a plurality of shaped reliefs (15) emerging from the bottom (10) so as to provide the support feet (6) with a base in elevation with respect to the bottom (10) itself. The shaped reliefs (15) being arranged in succession on at least two parallel orders and a plurality of areas (16) of the bottom (10) being interposed between each order so as to limit the overall dimensions of the reliefs (15).
