Abstract (en)

[origin: WO2021205116A1] Device for measuring a person's cardiac activity comprising: a processing unit, at least one measuring cable, including a first end capable of being connected to the processing unit in order to form an electrical potential input, and a second end, a holder that is ready for a person to wear, the holder supporting the cable so as to maintain a predefined route of the cable relative to the person's skin when the holder is worn. The cable is arranged such that any contact between an electrically conductive portion of the cable and the person's skin is prevented when the holder is worn. The second end of the cable is free of any electrodes in contact with the skin. The holder is arranged in order to maintain a predefined spacing between a measurement portion of the cable and the person's skin.
