Abstract (en)
[origin: WO2021206899A1] A reclosable lid for a container includes a base and a cover assembly connected relative to each other by a hinge and movable between an open configuration and a closed configuration. In the closed configuration, an access opening of the base is at least partially overlain by an access opening of the cover assembly. The cover assembly includes a cover that is moveable about a hinge from a closed position - blocking the access opening of the cover assembly - and an open position - exposing the access opening of the cover assembly. A tamper-evident feature in the form of one or more frangible connections between the cover and the remainder of the cover assembly are broken upon initial movement of the cover from the closed position to the open position.
