Abstract (en)

[origin: WO2021204688A1] The present invention relates to a transport hook for raising and moving a load, wherein the transport hook (1) comprises a lever portion (2) with a coupling element (4), by means of which the transport hook (1) can be connected to a lifting apparatus, and also comprises a hook limb (3), which, for the purposes of raising and moving the load (101), can engage in a hole (102) of the load (101). The hook limb (3) is connected to the lever portion (2) by means of an angled portion (14) such that an angle (α) of less than 90° forms between a line which extends from the coupling element (4) to a vertex (SP) of the angled portion (14) and a line which runs along the hook limb (3). The hook can grip a load through a small opening on an upwardly oriented surface and raise the load securely. The transport hook can be provided with different securing elements, which reliably prevent accidental release of the transport hook.
