Abstract (en)

The present description relates to a latch device for closure of a sliding door or window in a lock with clamp, comprising a latch and a latch case with said latch on one face of said case, wherein the latch pivots between a retracted position in the latch case and a protruding position from the latch case; wherein the pivoting latch comprises a magnet arranged in the latch with a first magnetic pole oriented outwardly on said face to create a magnetic repulsive force with a second magnetic pole, having the same polarity as the first pole and oriented opposite to the first magnetic pole, from another magnet placed in the lock so that the latch pivots from the retracted position to a protruding position to be locked by the clamp. It also relates to a lock with clamp comprising a lock case for receiving said latch on one face of said case, and comprising a magnet arranged in the lock with a first magnetic pole oriented outwardly on said face to create a magnetic repulsive force with a second magnetic pole, having the same polarity as the first pole and oriented opposite to the first magnetic pole, from another magnet placed on said latch so that the latch pivots from the retracted position to a protruding position to be locked by the clamp.
