Abstract (en)

[origin: WO2021219816A1] The moisture content plays an important role in drying, extraction, impregnation and reaction in liquid and supercritical CO₂. Current measuring solutions lack the accuracy, especially over time, to measure the water content. This may negatively impact the quality of the product and/or make the process much less efficient. The invention is a measurement device for measuring a ratio of (i) an amount of a first fluid in a supercritical state or liquid state and (ii) an amount of a second fluid in said first fluid, wherein the first fluid and the second fluid form a mixture, wherein the mixture is in a pressure vessel, wherein the pressure vessel has a vessel pressure and a vessel temperature, wherein the second fluid is water, and wherein the measurement device comprises: a heater arranged for receiving a sample stream of the mixture, and for heating the sample stream to a set temperature; a pressure reducing element provided downstream of the heater for adiabatic expansion of the sample stream, wherein the expanded sample stream has an expanded pressure and an expanded temperature; a humidity sensor arranged downstream of the pressure reducing element providing a humidity sensor value representing a humidity in the expanded sample stream; and a processor arranged for: receiving the humidity sensor value; adapting the set temperature for heating the sample stream to the adapted set temperature with the heater when the humidity sensor value is outside a humidity range having a minimum humidity value and a maximum humidity value; and calculating the ratio based on the humidity sensor value.
