Abstract (en)

[origin: WO2021228779A1] The invention relates to an electrical interconnection device (6) comprising a base (10), a system with two jaws (13) secured to the base, and a mechanism (15) secured to the base and configured to move the jaws together/apart and thus vary a space of a receiving zone (16) defined between the jaws, between a configuration in which the conductor is clamped in order to earth it, and a release or insertion configuration; the two jaws extending longitudinally and having respective inner faces (21) that are arranged so as to provide, in the receiving zone, a first distal recess (23) and a second proximal recess (24) situated between the first distal recess and the base, and the electrical interconnection device is configured to receive an electrical conductor (2) so as to earth it in the first distal recess and to receive another electrical conductor (3) in its second proximal recess.
