Abstract (en)

Embodiments of this application provide an access method, an apparatus, an electronic device, and a readable storage medium. The method includes: A network device sends first configuration information on a first downlink carrier, where the first configuration information indicates a first uplink resource; the network device receives a first signal or first information from the terminal device on the first uplink resource; and when determining, based on the first signal or the first information, that the terminal device accesses the network device on the first downlink carrier, the network device sends a downlink signal on the first downlink carrier. During random access by the terminal device, the network device may configure, for the terminal device, the first uplink resource on which a downlink carrier used to access the network device can be fed back. Therefore, the terminal device can feed back, on the first uplink resource, the downlink carrier used to access the network device. In this way, the network device can distinguish which downlink carrier is used by the terminal device to access the network device, and send the downlink signal on the downlink carrier. As a result, the terminal device can receive the downlink signal.
