Abstract (en)
[origin: US2021366065A1] A contract platform may receive, from data structures, historical contract data; read, from the historical contract data, numerical categorical data; process the numerical categorical data, with one or more artificial intelligence models, to convert the numerical categorical data into vector format; generate a taxonomy in vector format based on the converted numerical categorical data; read, from the historical contract data, nonnumerical noncategorical data; process the nonnumerical noncategorical data, with the models, to convert the nonnumerical noncategorical data into vector format; generate a knowledge graph in vector format based on the converted nonnumerical noncategorical data. The contract platform may receive a request that includes data identifying a new contract to be created; identify, in the taxonomy and in the knowledge graph, similar contracts; determine similarity scores between the data identifying the new contract and data identifying the similar contracts; and provide the similarity scores and the similar contracts.
