Abstract (en)

[origin: WO2021239393A1] The invention relates to an anchor rail (1) having a C-shaped cross-section for encasing in concrete, in which a lip (11) adjoining the slot-like opening (9) is reinforced. In order to provide high holding forces so that the hammer head element is secured against being pulled out, the invention proposes that a setting angle has a maximum value in an area that is closer to the side wall (10) than to the opening (9).
