Abstract (en)

A circuit breaker is disclosed that comprises: a frame; a breaker main body configured to connect and disconnect the circuit; a sensor connected to the breaker main body and configured to collect state parameters of the breaker main body; and a data processing module detachably mounted on the frame and electrically connected to the sensor, wherein the data processing module is configured to process state parameters collected by the sensor and output processed state parameters to a device outside the circuit breaker. The circuit breaker described here implements the full digital function and outputs state parameters of the circuit breaker in real time for use by the users. By a multi-dimensional operation monitoring, the management of the health condition of the circuit breaker is implemented, continuity and reliability of the operations are promoted, the maintenance cycle is extended, and the maintenance cost is reduced.
