Abstract (en)

[origin: WO2021245342A1] Disclosed is an optoelectronic device (10) for a light-emitting display, which device includes: a substrate (11); a light-emitting element (13) including at least one first electrode (13d), a plurality of primary conductors (22); secondary conductors (12); a first electrically insulative element (16); wherein, for said at least one light-emitting element (13), at least one first connecting portion (12a) of at least one of the secondary conductors (12) corresponding to said light-emitting element (13) is formed in all or part of a first recess (30) obtained in the first electrically insulative element (16), the first connecting portion (12a) of the secondary conductor (12) being in contact with the first electrode (13d).
