Abstract (en)
[origin: WO2021244692A1] The invention relates to a combinational distribution system for distribution of energy and matter, wherein the combinational distribution system is designed as a system of lines for distribution of energy or matter and has at least two sides, a side A (1) and a side B (2), which are reach connected by at least two lines (3), wherein the ends of the lines on side A (1) stand alone or are arranged in a plurality of predetermined groups in which they are connected to each other (4), whereas they are grouped and arranged (5) on side B (2) without being connected to each other, wherein two or more contact points (4) of the lines on side A (1) are combined such that only one of a plurality of combinations determines the address of one or more specific contact points (5) of the lines on side B (2) which are connected by means of the lines for distribution of energy or matter to combined contact points (4) of the lines on side A (1), and if energy or matter is sent via combined contact points (4) on side A (1), the lines deliver energy or matter only to specific contact points (5) on side B (2), or vice versa.
