Abstract (en)  
[origin: EP4163055A1] An adjustable sander having a body and a flexible base. The flexible base includes a first end and a second end spaced apart from one another. The first end and second end are each pivotally attached to the body. The flexible base is configured to move between a concave configuration, a neutral configuration, and a convex configuration relative to the body. The adjustable sander further includes a removable sanding surface affixed to a surface of the flexible base that is distal from the body. The adjustable sander also includes a locking mechanism configured to selectively hold the flexible base in a desired concave, neutral or convex configuration. The locking mechanism is characterized in that it includes an axial having a head and a shaft having a series of shaft notches. The locking mechanism further includes a selector having an operator surface and a holder. The operator surface is accessible from outside the body. The holder includes an engagement surface having at least one holder notch configured to selectively engage at least one of the shaft notches. The selector is selectively movable between an engaged position wherein the at least one holder notch is engaged to one of the shaft notches, and a disengaged position, wherein the at least one holder notch is disengaged from the shaft notches.
