Abstract (en)  
[origin: EP4163188A1] [Problem] To improve flexibility of layout in a vehicle cabin while increasing vehicle body stiffness.[Means for Solution] A vehicle-body structure A includes a floor panel 41, a center frame 80 disposed to be higher than and away from the floor panel 41, and an air-conditioning device 120. The air-conditioning device 120 includes an air distribution portion 123 that is positioned higher than a front portion of the center frame 80 and distributes generated air-conditioned air to each portion of an occupant space, and under-feet ducts 124A and 124B that guide air-conditioned air to a lower side. The under-feet ducts 124A and 124B each extend downward from the upper side of the center frame 80 through a vehicle-width-direction outer side of the center frame 80.
