Abstract (en)

The device comprises a tab (1), which has raised flanges (8), arranged at the outlet of the water channel (5) of a top enclosure with a slope that bridges the distance between the header (2) and the beam (10) in such a way that it collects the water from the water channel directing it towards the beam (10) where by capillary effect it runs down the side of the beam (10) to a lower gutter (6) that runs longitudinally along the beam carrying the water towards a drain or towards the ground.
