Abstract (en)

[origin: WO2021254913A1] Device (D) for reversibly anchoring cladding panels (5) to associated support structures (6), comprising a tubular body (1) whereinto a braked piston (2) is axially inserted, the tubular body (1) having a rear side (11) configured such as to engage with a support structure (6) by means of an elastic surface (41) formed on said rear side (11), and an opposing front emerging end of the piston (2). The piston (2) has an anchoring surface (20) which is configured in such a way that it can be anchored to a cladding panel (5), and is braked by means of plungers (3, 30; 13) arranged and acting on the side (10) where the piston (2) emerges from the body (1). The plungers are arranged in symmetrical positions in relation to the piston (2), and the plungers (3, 30) are adjustable plungers.
