Abstract (en)
[origin: WO2021253063A1] The invention relates to a system for testing a driver assistance system of a vehicle. The driver assistance system has at least one interior sensor and is designed to process sensor signals of the at least one interior sensor in order to monitor a driver of the vehicle. The system has: simulation means for simulating at least one physical property of the driver, said property characterizing a physiological state of the driver, in particular attentiveness, activity, fatigue, mood, state of health, and/or the influence of drugs and being detectable by the at least one interior sensor such that the interior sensor can generate sensor signals on the basis of the at least one simulated physical property; and an interface which interacts with the driver assistance system such that sensor signals are provided by the driver assistance system on the basis of the at least one simulated physical property. The invention also relates to a corresponding method.
