Abstract (en)

[origin: WO2021255355A1] The invention relates to a method and a device for monitoring the communication from a first vehicle (11). To this end, one or more objects are detected in the surroundings of the first vehicle (11). Each object is detected by one or more sensors of a system for detecting a wave irradiation object on board the first vehicle (11). The first vehicle (11) receives from a second vehicle (12) a request for a communication connection to be established between the first vehicle (11) and the second vehicle (12) according to a vehicle-to-everything communication mode, referred to as a V2X communication mode. The first vehicle (11) determines whether there is a match between the second vehicle (12) and one of the detected objects. The connection request is validated or rejected depending on whether a match between the second vehicle (12) and one of the detected objects is ascertained.
