Abstract (en)

The invention comprises a T-shaped body (1) formed by a base (1a) and a gripping wing (1b) that is arranged in a plane perpendicular to the plane in which the base (1a) is located, base which includes a concave lower face configured to rest on an adhesive material, and a flat upper face on which the adjoining flat part (15) rests, from which the gripping wing (1b) extends. The areas of the lateral legs (5) close to the base (1a) include opposing pairs of angular weakenings (10) in combination with additional weakenings formed by holes (11); wherein both weakenings (10) and weakenings (11) are located in one same alignment (12) parallel to the plane in which the base (1a) is located. The combination of said weakenings facilitates and improves the breakage and separation of the gripping wing when the assembly has already been completed.
