Abstract (en)
This application relates to the field of article packaging technologies, and in particular, to a packing box. The packing box provided in this application includes an inner box and an outer box, where an inner wall of the outer box is provided with a first abutting portion, an outer side wall of the inner box is provided with an elastic protruding portion, and when the inner box is accommodated in a first accommodating cavity of the outer box, the elastic protruding portion abuts against the first abutting portion in a pull-out direction, and in this case, the packing box is in an locked state; and when the elastic protruding portion is pressed by using an external force, the elastic protruding portion is staggered with the first abutting portion, so that the inner box and the outer box are in an unlocked state. A locking structure is formed by using the elastic protruding portion and the first abutting portion for the packing box, and the locking structure is relatively simple. In addition, the locked state can be released by pressing the elastic protruding portion by using a finger, and the unlock is very convenient. Because the locking structure of the packing box is arranged in the first accommodating cavity, the unlocking position is relatively concealed, which can effectively prevent children from opening by mistake.
