Abstract (en)

An air conditioning system includes an air conditioner (11) and an air conditioning controller (50, 55), in which the air conditioning controller has, as a control mode, a first mode in which the air conditioner performs a preheating operation or a precooling operation at or after a first time (t_e) set in advance and at or before a second time (t_s) at which the target space is used next, the first mode is a control mode of operating the air conditioner and stopping the air conditioner when the temperature of the target space increases to a preheating temperature ($T_{sub>H</sub>$) higher than a target temperature ($T_{sub>M</sub>$) of the target space at the second time (t_s) or when the temperature of the target space decreases to a precooling temperature ($T_{sub>L</sub>$) lower than the target temperature ($T_{sub>M</sub>$), the preheating temperature ($T_{sub>H</sub>$) is set such that the temperature of the target space becomes the target temperature ($T_{sub>M</sub>$) or higher than the target temperature ($T_{sub>M</sub>$) at a point of the second time (t_s), and the precooling temperature ($T_{sub>L</sub>$) is set such that the temperature of the target space becomes the target temperature ($T_{sub>M</sub>$) or lower than the target temperature ($T_{sub>M</sub>$) at the point of the second time (t_s).
