Abstract (en)

[origin: WO2021259438A1] We disclose herein a mounting plate for a lock system, configured to be secured to a closure, the mounting plate comprising: a first major surface and a second major surface; a first and a second elongate aperture each extending from the first major surface to the second major surface, and each having a major axis extending along the length of the first elongate aperture, wherein each of the first and second elongate apertures are shaped to receive a lock cylinder therethrough; wherein the major axis of the first elongate aperture and the major axis of the second elongate aperture are arranged at a non-zero angle to one another; and wherein the second elongate aperture intersects the first elongate aperture off-centre from a centroid of the first and second major surfaces, thereby providing a region of intersection to receive a portion of a lock cylinder therethrough.
