Abstract (en)  
[origin: WO2022003000A1] The present patent application relates to a two-phase composition consisting of an aqueous phase and of a nonsilicone oily phase which are separate and transparent, characterized in that the aqueous phase comprises water, at least one alkylpolyglycoside surfactant, and at least one diol including at least 5 carbon atoms, preferably of C5-C10, and the oily phase comprises at least 75% by weight, relative to the total weight of the oily phase representing 100%, of at least one alkane, ether or ester compound comprising from 15 to 30 carbon atoms. The present invention also relates to the use of plant oil in such a two-phase composition for, after shaking said composition, slowing down the rate of demixing of the two phases of the composition and/or for improving the sharpness of the interface between the two phases and/or prolonging the sharpness of the interface at rest of the two-phase product after several cycles of use of the two-phase product.
