Abstract (en)

[origin: WO2021244869A1] The invention relates to a method for operating a monitoring device (1), the monitoring device (1) being designed to monitor a heating system (2). In the method, pressure measurement values are regularly captured on a secondary side S of the heating system (2) and are stored. Historical pressure measurement values W_h of the secondary side S are compared with current pressure measurement values W_a on the secondary side S. The comparison can be used to create statements and predictions regarding an operating and maintenance status of the heating system (2).
