Abstract (en)

[origin: EP4181453A1] Embodiments of this application provide a synchronization signal block transmission method and a communication apparatus. The method includes: receiving a first synchronization signal block SSB from a network device, where the first SSB is a first-type SSB for a first terminal device; and if the first SSB is a second-type SSB for a second terminal device, determining a first control-resource set and/or first common search space based on the first SSB. In the method, different results may be obtained when the second terminal device and the first terminal device identify a type of the first SSB, and the second terminal device and the first terminal device may use the first SSB in different manners. For example, the second terminal device may determine the first control-resource set and/or the first common search space based on the first SSB, to improve utilization of the SSB.
