Abstract (en)

[origin: WO2022015164A1] The present invention relates to a replenishing system, comprising: an input that is configured to be arranged in liquid connection with a pressurized liquid supply; a replenishing output that is configured to be arranged in liquid connection with a pressurized liquid circulating system; and a collector that is arranged between the input and the replenishing output and that comprises a gas extractor. The invention further relates to a method of replenishing a liquid into a pressurized liquid circulating system, comprising the steps of: allowing liquid to enter the replenishing system, thereby filling a collector that is arranged between an input and a replenishing output of the replenishing system; extracting gas out of said liquid in said collector; and allowing liquid to flow from the pressurized liquid supply through the replenishing system and into the pressurized liquid circulating system to set a pre-determined operating pressure in the pressurized liquid circulating system.
