Abstract (en)

The manufacturing device for a reconstituted tobacco sheet comprises a die that discharges reconstituted tobacco raw material. The die includes a housing, a feed port that is formed in the housing and to which the reconstituted tobacco raw material is fed, and a discharge port that is formed in one side face of the housing and from which the reconstituted tobacco raw material is discharged. The manufacturing device for a reconstituted tobacco sheet further comprises a condition detecting portion that detects a condition of the reconstituted tobacco raw material in an interior portion of the die or a condition of the reconstituted tobacco raw material discharged from the die, and a control portion that controls behavior of the manufacturing device for a reconstituted tobacco sheet. The condition detecting portion outputs an electric signal according to a detection result of the condition of the reconstituted tobacco raw material to the control portion.
