Abstract (en)

Device (100) for the diatonic connection of the two faces (201, 202) of a hollow box wall (200); said device (100) comprising a shank (1) having a first end (10) and a second end (11), a flange (2) suitable for projecting radially outwardly from the first end (10) of the shank and a bottom (3) disposed in the second end (11) of the shank; wherein the shank (1) is suitable for passing through a hole (205) of the first face (201) of the wall, in such a way that the bottom (3) is attached to an inner surface (202a) of the second face of the wall by means of an adhesive cushion (4) and the flange (2) is attached to an outer surface (201b) of the first face by means of an adhesive.
