Abstract (en)

[origin: EP4185009A1] Embodiments of this application provide a packet forwarding method, an apparatus, and a system, and relate to the field of communication technologies, to mitigate existing technical problems of a large quantity of signaling exchanges and a long switching delay when a session management network element modifies a PDU session. The method includes: A session management network element sends a path identifier to a first device, where the first device includes an access network element corresponding to a PDU session and a user plane network element corresponding to the PDU session, the PDU session corresponds to a first terminal, the path identifier indicates a first path from the access network element to the user plane network element, the first path includes a part or all of a second path, and the second path is a path corresponding to a PDU session pre-established by the session management network element for a second terminal. The session management network element further sends, to the first device, identification information of a destination address corresponding to the path identifier, to enable the first device to include, in received data based on the destination address of the data, the path identifier corresponding to the destination address, and forward the data through a path corresponding to the destination address.
