Abstract (en)
[origin: WO2022023300A1] The invention relates to a hitching device designed to allow the hauling of a structure (1) by a vehicle (50), the hitching device comprises a support portion (10) able to be integral with the structure (1), a movable portion (20), comprising a profiled element (21) and a hitching end (22), the movable portion (20) being configured in order to be able to perform a movement in translation and/or rotation about an axis of rotation (210) extending parallel to a longitudinal direction of the profiled element (21) so as to be able to selectively switch between a retracted configuration and a deployed configuration, the hitching device comprises at least one interface part (30) comprising an interior interface configured to allow a guidance in translation of the profiled element (21), and an exterior interface configured so as to allow the interface part (30) to rotate with respect to the support portion (10) about the axis of rotation (210).
