Abstract (en)  
[origin: EP4191365A1] This application provides a foldable electronic device, including a first main body, a second main body, a rotating shaft assembly, a flexible screen, and a protective bracket. The first main body and the second main body are connected through the rotating shaft assembly, the flexible screen is disposed on the first main body and the second main body, and the first main body and the second main body may rotate relative to the rotating shaft assembly towards a side having the flexible screen. The flexible screen includes a bending region and a first non-bending region and a second non-bending region that are respectively located on two sides of the bending region. The protection bracket includes a flexible part, a first metal part, and a second metal part. The flexible part is disposed on the flexible screen, and includes a main body segment, a first connection segment, and a second connection segment. One end of the first metal part is embedded in the first connection segment, and the other end is fixedly connected to a bezel of the first main body. One end of the second metal part is embedded in the second connection segment, and the other end is fixedly connected to a bezel of the second main body. This application provides a foldable electronic device, to protect a bending region of a flexible screen.
