Abstract (en)

[origin: WO2022029472A1] The invention concerns a system (1) for cleaning rivers and watercourses (F) in general comprising a plurality of floating modules (10) and anchoring means (30) to constrain said floating modules (10) to at least one fixed point so that they are aligned along a line (X) generally transversal to the direction (W) of the water flow. Each of said floating modules (10) comprises at least one sliding surface (11) configured to form, together with the sliding surfaces (11) of other said aligned floating modules (10), a sliding path (12) which crosses the watercourse transversely, along which, the material floating on the water flows towards at least one collection area (20).
