Abstract (en)

[origin: WO2022031557A1] Various embodiments herein provide techniques for network slicing in a wireless cellular network. For example, embodiments may include deriving a radio access technology (RAT) frequency service profile (RFSP) index and/or frequency priority information for a user equipment (UE) based on allowed and rejected network slice selection assistance information (NSSAI). Additionally, embodiments may include techniques for network slicing based on UE radio capability, e.g., for dual connectivity (DC) and/or carrier aggregation (CA). Other embodiments may be described and claimed.
