Abstract (en)  
The present invention relates to a handle for doors and windows suitable for a wide set of profiles of different widths and opening types, without hindering the operation or aesthetics of the handle, ensuring the correct positioning of a rotation shaft in an initial clipping situation. The handle is intended to be linked to a transmission mechanism (1) arranged on the inside of a profile (2) equipped with a flange (4) comprising a die-cut or machining (3), wherein the handle comprises a lever (5) intended to be arranged on the outside of the profile (2), a rotation shaft (6), a base (9), an anchor plate (11), a retaining bushing (13) that is partially housed in the base (9) and a compressible clipping element (49) that in an assembly situation is housed in the groove (15) in a decompressed position and retains the rotation shaft (6) in a longitudinal direction.
